

## Toolkit V1.0.3R

### 一，接口简介

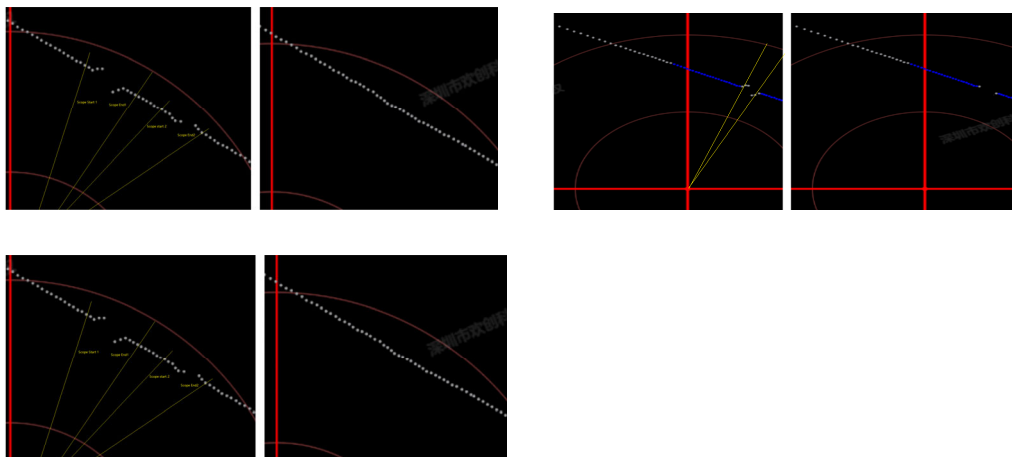

a，对 1 圈点云数据进行噪点滤除单孤点、双孤点、射线干扰点，单项可选开启/关闭

射线状干扰是指，强光、双激光互扰等造成的 line 状且趋势延长线与‘圆心域’内有园切的 Ray line 状干扰；

点状干扰是指，非聚类的孤立（单或 N）点；

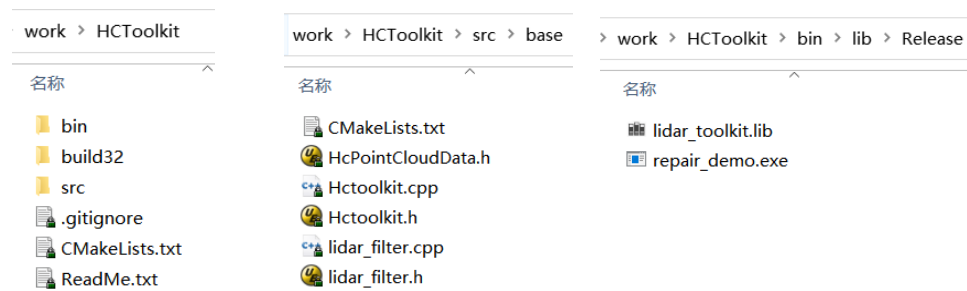

b，前柱 Shadow 集成了 Shadow 缺口清除、平滑、插补处理接口；

c，回充识别，基于特征码回充识别接口，基于亮度差的回充识别接口，可设定识别功能区范围。

### 二，文件

### 三，编译，

Compile command (Need compiler which supports C++11)

#### 1) Windows

mkdir build

cd build

cmake -G "Visual Studio 15 2017" ..

(Notice: please change the cmake command if you use other compiler)

#### 2) Linux

mkdir build

cd build

cmake ..

make

### 四，库、头文件

HcPointCloudData.h	2022/5/13 18:46	C++ Header file	14 KB
Hctoolkit.h	2022/5/14 13:50	C++ Header file	10 KB
lidar_toolkit.lib	2022/5/14 13:55	Object File Library	156 KB

### 五，接口调用示例 repair\_demo.cpp

```
#include "base/Hctoolkit.h"

int main()
{
    int rtn = 0;

    string ss = GetVer();

    //If need Filter
    hcSDKFltInitialize();
    printf("hcSDKFltInitialize() complete\n");

    //To update lidar paras of model "X2B"
    stFltLidarCfg_t stLidarPara;
    bool bLowSpinSpeed = false;
    if(UpdateLidarPara("X2B", bLowSpinSpeed, stLidarPara))
    {
        printf("The stLidar Para with default value\n");
    }

    //The tsPtClouds of 1-circle Point Clouds to be processed
    std::vector<stPtCloud_t> tsPtClouds;
    printf("tsPtClouds' size is %d \n",tsPtClouds.size());

    //Can Overwrite stFltGblSetting or stFltLParas here,
    //or with the default value which defined with micro-Define in HcPointCloudData.h
    stFltGblSetting_t stFltGblSetting;
    stFltLParas_t stFltLParas;
    stFltGblSetting.fFacAdjHSpd = 3.0;
    stFltLParas.nActDist = 1000;

    //Call Filter function
    hotPixelFilter(tsPtClouds, stLidarPara, stFltGblSetting, stFltLParas);
    printf("Result Data in 'tsPtClouds' \n");

    //If need Filter, to Close module
    hcSDKFltUnInit();

    getchar();
    return 0;
} « end main »
```

## 六，接口函数

```
//Noise Tools interface

/*****
//版本
*****/
char* GetVer();

/*****
//初始化
*****/
bool hcSDKFltInitialize();

/*****
//释放
*****/
bool hcSDKFltUnInit();

/*****
// 输入:
//      sLidarModel-eg. "X2F"
//      bLowSpeed - true for Low Spin-Speed
// 输出:
//      stFltLidarCfg - Lidar Paras
// Return:
//      true: sLidarModel exist in list,false: not in list
*****/
bool UpdateLidarPara(const char* sLidarModel, bool bLowSpeed, stFltLidarCfg_t &stFltLidarCfg);

/*****
//通用接口函数: 作用域内,通过eFltType选择过滤器类型 (普通、强光、通用场景)
//输入:
//      1stPointCloud - 1 圈点云数据
//      eFltType - Filter 类型选择
//      stFltLidarCfg - Paras of 雷达
//      stFltGblSetting - Global 参数
//      stFltLParas - Line filter 参数
//输出:
//      1stPointCloud - 处理后的点云数据
*****/
void HotPixelFilterGblEx(ava_msg_lds_pack& 1stPointCloud,eFltType_t eFltType,const stFltLidarCfg_t &stFltLidarCfg,stFltGblSetting_t stFltGblSetting,stFltLParas_t stFltLParas);

/*****
//通用接口函数: 作用域内,通过eFltType选择过滤器类型 (普通、强光、通用场景)
//输入:
//      1stPointCloud - 1 圈点云数据
//      eFltType - Filter 类型选择
//      stFltLidarCfg - Paras of 雷达
//      stFltGblSetting - Global 参数
//      stFltLParas - Line filter 参数
//输出:
//      1stPointCloud - 处理后的点云数据
*****/
void HotPixelFilterGbl(std::vector<stPtCloud_t> &1stPointCloud,eFltType_t eFltType,const stFltLidarCfg_t &stFltLidarCfg,stFltGblSetting_t stFltGblSetting,stFltLParas_t stFltLParas);
```

## Pillar Shadow 接口

```

//*****
//前柱遮挡区域的清除处理 - 在设定的距离、角度的扇形区域内
//输入：
//      1stPointCloud - 1 圈点云数据
//      stPillarShadow - 要清除区域的起始角度、结束角度、区域的远距离，滤除平衡系数，滤除度设定：0/全点滤除，1/1孤点滤除，2/2孤点滤除，N/N孤点滤除
//      stFltLidarCfg - Paras of 雷达
//输出：
//      1stPointCloud - 处理后的点云数据
//*****
void PillarShadowClear(1stPtCloud_t &1stPointCloud,const stFltLidarCfg_t &stFltLidarCfg,const stPillarShadow_t &stPillarShadow);

//*****
//前柱缺口的补缺-在设定距离、角度的扇形区域内
//输入：
//      1stPointCloud - 1 圈点云数据
//      stPillarShadow - 要清除区域的起始角度、结束角度、区域最远距离，修补迭代次数，Gap时变最大阈值设定
//      stFltLidarCfg - Paras of 雷达
//输出：
//      1stPointCloud - 处理后的点云数据
//*****
void PillarShadowSmooth(1stPtCloud_t &1stPointCloud,const stFltLidarCfg_t &stFltLidarCfg,stPillarShadow_t &stPillarShadow);

//*****
//前柱缺口的补缺-在设定距离、角度的扇形区域内
//输入：
//      1stPointCloud - 1 圈点云数据
//      stPillarShadow - 要清除区域的起始角度、结束角度、区域的远距离，修补迭代次数，Gap补缺角偏差（° 默认0）
//      stFltLidarCfg - Paras of 雷达
//输出：
//      1stPointCloud - 处理后的点云数据
//*****
void PillarShadowRepair(1stPtCloud_t &1stPointCloud,const stFltLidarCfg_t &stFltLidarCfg,stPillarShadow_t &stPillarShadow);

//*****
//前柱遮挡区域的清除处理 - 在设定的距离、角度的扇形区域内
//输入：
//      1stPointCloud - 1 圈点云数据
//      stPillarShadow - 要清除区域的起始角度、结束角度、区域的远距离，滤除平衡系数，滤除度设定：0/全点滤除，1/1孤点滤除，2/2孤点滤除，N/N孤点滤除
//      stFltLidarCfg - Paras of 雷达
//输出：
//      1stPointCloud - 处理后的点云数据
//*****
void PillarShadowClearEx(ava_msg_lds_pack& 1stPointCloud,const stFltLidarCfg_t &stFltLidarCfg,const stPillarShadow_t &stPillarShadow);

//*****
//前柱缺口的补缺-在设定距离、角度的扇形区域内
//输入：
//      1stPointCloud - 1 圈点云数据
//      stPillarShadow - 要清除区域的起始角度、结束角度、区域最远距离，修补迭代次数，Gap时变最大阈值设定
//      stFltLidarCfg - Paras of 雷达
//输出：
//      1stPointCloud - 处理后的点云数据
//*****
void PillarShadowSmoothEx(ava_msg_lds_pack& 1stPointCloud,const stFltLidarCfg_t &stFltLidarCfg,stPillarShadow_t &stPillarShadow);

//*****
//前柱缺口的补缺-在设定距离、角度的扇形区域内
//输入：
//      1stPointCloud - 1 圈点云数据
//      stPillarShadow - 要清除区域的起始角度、结束角度、区域的远距离，修补迭代次数，Gap补缺角偏差（° 默认0）
//      stFltLidarCfg - Paras of 雷达
//输出：
//      1stPointCloud - 处理后的点云数据
//*****
void PillarShadowRepairEx(ava_msg_lds_pack& 1stPointCloud,const stFltLidarCfg_t &stFltLidarCfg,stPillarShadow_t &stPillarShadow);

```

## 回充识别接口

```

//*****
//通用接口函数：定位回充基站
//输入：
//      1stPointCloud - 1 圈点云数据
//      eRechargeType - 定位类型
//      stFltLidarCfg - 雷达参数
//      stReChargeSetting - 全局配置参数
//      stReChargeSetting - 回充设定参数
//输出：
//      stReChargeDir - 定位参数
//*****
void RechargeLocateGb1(1stPtCloud_t &1stPointCloud,const eRechargeType_t &eRechargeType,const stFltLidarCfg_t &stLidarCfg, stReChargeSetting_t &stReChargeSetting,stReChargeDir_t &stReChargeDir);

//*****
//初始化点云回充特征码参数
//输入：
//      na1,nb1,na2,nb2, - 雷达属性包上传的特征码系数值
//      nSpecCalibDist1 - 指定值(默认值)，对应于‘特征码系数值’的距离参数-1
//      nSpecCalibDist2 - 指定值(默认值)，对应于‘特征码系数值’的距离参数-2
//      nSpecValue - 回充特征码值(默认255)
//输出：
//      m_stSpecCodeParas - 初始化后的回充特征参数
//*****
void InitSpecCodeParas(const int &na1,const int &nb1,const int &na2,const int &nb2,const int &nSpecValue,
const int &nSpecCalibDist1,const int &nSpecCalibDist2,const std::vector<stSpecGrayDifCalib_t> &1stGrayDifCalib,const int &nBarGraySecBrkDif,const int &nBarGrayFitDif,const int &nSpecGrayMin,
const int &nSpecGrayMax);

```

## 回充接口例程

```

m_stRechargeDirect.angle_disp = 0;
m_stRechargeDirect.dist = 0;
if(g_sSysPara.nShadowWorkType >= PILLAR_GAP_NOTHING && g_sSysPara.nRechargeWorkType < RECHARGE_NOTHING)
{
    stRechargeDir_t stRechargeDir;
    std::vector<stSpecGrayDiffCalib_t> lstGrayCalib;
    if(g_sSysPara.nRechargeWorkType == RECHARGE_SPEC_CODE) //特征码回充调用
    {
        std::vector<UINT16> lstRch;
        getSDKRechargeValue(lstRch);
        if(lstRch.size())
        {
            InitSpecCodeParas(lstRch[0],lstRch[1],lstRch[2],lstRch[3],g_sSysPara.stRechSpecCodeParas.nSpecValue,
                g_sSysPara.stRechSpecCodeParas.nSpecCalibDist1,g_sSysPara.stRechSpecCodeParas.nSpecCalibDist2,
                lstGrayCalib,g_sSysPara.stRechSpecCodeParas.nBarGraySecBrkDif,g_sSysPara.stRechSpecCodeParas.nBarGrayFltDif,
                g_sSysPara.stRechSpecCodeParas.nSpecGrayMin,g_sSysPara.stRechSpecCodeParas.nSpecGrayMax);
            RechargeLocateGbl(stPtCloudData,(eRechargeType_t)g_sSysPara.nRechargeWorkType,stFltLidarCfg,g_sSysPara.stRechargeSetting,stRechargeDir);
            m_stRechargeDirect.angle_disp = fmod(stRechargeDir.dAngleTo + g_sSysPara.sProject.fPointCloudAng + m_fAngOffset,360.0);
            m_stRechargeDirect.dist = stRechargeDir.nDistTo;
        }
    }
    else //灰度差回充调用
    {
        std::vector<stSpecGrayDiffCalib_t> lstGrayCalib;
        getSDKRechargeGrayDiffCalib(lstGrayCalib);
        InitSpecCodeParas(0,0,0,0,g_sSysPara.stRechSpecCodeParas.nSpecValue,
            g_sSysPara.stRechSpecCodeParas.nSpecCalibDist1,g_sSysPara.stRechSpecCodeParas.nSpecCalibDist2,
            lstGrayCalib,g_sSysPara.stRechSpecCodeParas.nBarGraySecBrkDif,g_sSysPara.stRechSpecCodeParas.nBarGrayFltDif,
            g_sSysPara.stRechSpecCodeParas.nSpecGrayMin,g_sSysPara.stRechSpecCodeParas.nSpecGrayMax);
            RechargeLocateGbl(stPtCloudData,(eRechargeType_t)g_sSysPara.nRechargeWorkType,stFltLidarCfg,g_sSysPara.stRechargeSetting,stRechargeDir);

        m_stRechargeDirect.angle = stRechargeDir.dAngleTo;
        m_stRechargeDirect.angle_disp = fmod(stRechargeDir.dAngleTo + g_sSysPara.sProject.fPointCloudAng + m_fAngOffset,360.0);
        m_stRechargeDirect.dist = stRechargeDir.nDistTo;
    }
}
} // end if g_sSysPara.nShadowWorkType >= PILLAR_GAP_NOTHING

```

## 七，参数定义

### 1，输入点云数据类型

dAngle, u16Dist, u16Gray, bGrayTwoByte, dAngleRaw 是 toolkit 使用项，“其它”后面为选配项

```

//用于定义 点云 类型，Toolkit 用于处理1圈点云数据
typedef struct _stPtCloud
{
    //Toolkit 涉及变量
    bool          bValid;           // true:有效点, false:非有效点
    double        dAngle;           // 点云角度 °
    UINT16        u16Dist;          // 点云距离,mm
    UINT16        u16Gray;          // 亮度
    UINT16        u16Speed;         // 雷达转速, RPM

    bool          bGrayTwoByte;     // true: u16Gray存储2字节亮度信息,false u16Gray 存储1字节亮度信息
    double        dAngleRaw;        // 矫正前的初始点云角度。(前柱补缺模块中使用的变量)
    UINT8         u8Stable;         // 保留位
    UINT8         u8Row;            // 行
    UINT8         u8Col;            // 列

    // 其它 可选配
    double        dAngleDisp;       // 点云显示工具用变量,无用到
    UINT16        u16DistRaw;       // 初始点云距离,mm
    UINT64        u64TimeStampMs;   // 时间戳 ,ms
    float         fTemperature;     // 温度

    _stPtCloud() :
    {
        bValid(true),
        dAngle(0.),
        dAngleRaw(0.),
        u16Dist(0),
        u16Gray(0),
        bGrayTwoByte(false),
        u8Stable(0),
        u8Row(0),
        u8Col(0),

        dAngleDisp(0.),
        u16DistRaw(0),
        u16Speed(0),
        u64TimeStampMs(0),
        fTemperature(0)
    }
} // « end _stPtCloud »
typedef struct _stPtCloud_t;
typedef std::vector<stPtCloud_t> lstPtCloud_t;

```

### 2，Toolkit 内部使用类型定义

```

typedef struct _FltCloudD          //Flt Cloud Data
{
    double        x;                //X 坐标 x = dist * cos(angle_rad_cur);
    double        y;                //Y 坐标 y = dist * sin(angle_rad_cur);
    UINT16        u16Dist;          //距离
    double        dAngle;           //原始角度 (°)
    bool          bValidIs;         //true:有效点 false:无效点
    int           nfound;           //程序动态标记

    _FltCloudD():
    {
        x(65535),
        y(65535),
        u16Dist(65535),
        dAngle(0),
        bValidIs(1),
        nfound(0)
    }
} //« end _FltCloudD_t;
typedef struct _FltCloudD_t;

```

### 3，Lidar 类型定义

```

#define DIST_INNER_CIRCLE 140 //mm Blind area size; eg. D2?:140, X2? 120, X1?100
#define LIDAR_FPS 3000 //帧率/second
#define LIDAR_RPM 360 //转速/minute
#define H_L_SPD_THRES 210 //Threshold of High/Low Spin-speed,design value;Eg. X2MF(180/360 L/H RMS) : 270, X2F(360 RMS):270,D2S(300):210

typedef struct _FltLidarCfg //Lidar Paras
{
    unsigned int nBlindDist; //盲区内被清除的距离 mm
    unsigned int nFPS; //帧率/second
    unsigned int nSpinSpeed; //转速/minute: 设计指标. 高低转速切换时, 需更新此值
    int nLHSpdThres; //Threshold of High/Low Spin-speed,design value;Eg. X2MF(180/360 L/H RMS) : 270, X2F(360 RMS):270,D2S(300):210

    _FltLidarCfg():
    {
        nFPS(LIDAR_FPS),
        nSpinSpeed(LIDAR_RPM),
        nBlindDist(DIST_INNER_CIRCLE),
        nLHSpdThres(H_L_SPD_THRES)
    }
}stFltLidarCfg_t;

```

#### 4，射线滤除类型定义

```

#define ORG_REGION_L 65 //mm, Ray valid area,Better to opt.till now need not;
#define DIST_CLEAR_MAX_L 600 //mm, Line Clear Max,Better to opt
#define LINAR_OFST_MAX_L 3 //Max offset of Spot to the ray
#define LINAR_CNT_L 3 //Min Spots of Ray

typedef struct _FltLParas //L filter paras
{
    unsigned int nActDist; //mm,Ray-line 滤除有效范围, 如600mm
    unsigned int nCirCenFld; //mm,射线到原点距离阈值, 如65mm
    unsigned int nPtToLineMin; //mm,同一直线点的距离阈值, 如3mm
    unsigned int nPtOfLineMin; //点->线最小点数阈值

    _FltLParas()
    {
        nActDist = DIST_CLEAR_MAX_L;
        nCirCenFld = ORG_REGION_L;
        nPtToLineMin = LINAR_OFST_MAX_L;
        nPtOfLineMin = LINAR_CNT_L;
    }
}stFltLParas_t;

```

#### 4，滤除范围、均衡性类型定义

```

#define SHARK_GRAY_THRES 50 //bGrayTwoByte true:400,false:50
#define HALOGEN_GRAY_THRES 7000 //Feature of Stronglight, need to adj., eg. bGrayTwoByte true:7000,false:255
#define ANG_COMP_OFST 50 //Angle offset value
#define DIST_OUTER_CIRCLE 1000 //mm Range-limit,may Adjust as required

#define FAC_HSPD_ADJ 3.0 //balance factor of high RPM, is to spot which is filtered out or left
#define FAC_LSPD_ADJ 3.0 //balance factor of low RPM,is to spot which is filtered out or left

typedef struct _FltGblSetting
{
    float fFacAdjHSpd; //杂点滤除平衡系数-高转速
    float fFacAdjLSpd; //杂点滤除平衡系数-低转速
    bool bFltRayLOn; //true: RayLine Flt on, false:Off
    bool bFlt1DotOn; //true: 1 Dot Flt on, false:Off
    bool bFlt2DotOn; //true: 2 Dot Flt on, false:Off, active in strong-light region
    int nFltNDotOn; //Nb2: N Dots Flt on, 0: Off, active in strong-light region
    unsigned int nActDist; //整体作用域 (单位: mm)
    double dActScopeSt; //0-360>Action is limited in the region of st-end;if dActScopeSt == dActScopeEnd mean the angle-limitation is invalid
    double dActScopeEnd; //0-360>Action is limited in the region of st-end;if dActScopeSt == dActScopeEnd mean the angle-limitation is invalid
    bool bScopeSmallIs; //true: acting in small region between dActScopeSt and dActScopeEnd, false: acting in big region between dActScopeSt and dActScopeEnd
    bool bPtActiveSt; //true or false, Valid Point Flag Setting
    unsigned int nHalogenGrayThres; //7000*,Feature of Stronglight, need to adj., eg. bGrayTwoByte true:7000,false:255
    unsigned int nSharkGrayThres; //bGrayTwoByte true:400,false:50
    unsigned int nAngExtent; //(← Center →),Range (°)

    _FltGblSetting()
    {
        fFacAdjHSpd = FAC_HSPD_ADJ;
        fFacAdjLSpd = FAC_LSPD_ADJ;
        bFltRayLOn = true;
        bFlt1DotOn = true;
        bFlt2DotOn = true;
        nFltNDotOn = 0;
        nActDist = DIST_OUTER_CIRCLE;
        dActScopeSt = 0.0;
        dActScopeEnd = 0.0;
        bScopeSmallIs = true;
        bPtActiveSt = true;
        nHalogenGrayThres = HALOGEN_GRAY_THRES;
        nSharkGrayThres = SHARK_GRAY_THRES;
        nAngExtent = ANG_COMP_OFST;
    }
}« end _FltGblSetting » stFltGblSetting_t;

```

#### 5，前柱 Shadow 类型定义

```

#define PILLAR1_SHADOW_ANG_ST 0
#define PILLAR1_SHADOW_ANG_END 0
#define PILLAR1_SHADOW_ANG_ST_2 0
#define PILLAR1_SHADOW_ANG_END_2 0

#define PILLAR2_SHADOW_ANG_ST 0
#define PILLAR2_SHADOW_ANG_END 0
#define PILLAR2_SHADOW_ANG_ST_2 0
#define PILLAR2_SHADOW_ANG_END_2 0

#define PILLAR3_SHADOW_ANG_ST 0
#define PILLAR3_SHADOW_ANG_END 0
#define PILLAR3_SHADOW_ANG_ST_2 0
#define PILLAR3_SHADOW_ANG_END_2 0

#define PILLAR_CLEAR_NODE_PT_NUM 0
#define PILLAR_SMOOTH_NODE_PT_NUM 5

#define PILLAR_CLEAR_SHADOW_FAC_ADJ 1.0
#define PILLAR_REP_DIST_THRES 150
#define PILLAR_REP_ITERATOR_NUM 5
#define PILLAR_REP_PILLAR_DIST 50
#define PILLAR_REP_ANG_OFFSET 0

```

```

typedef struct _PillarShadowParas //前柱遮挡区域的处理参数
{
    unsigned int nActDist; //mm,Pillar shadow 处理的有效范围, 如60000mm

    double d1ShadowScopeSt; //柱1, 如无, 设为0; Shadow region Gap-1 start angle (°); 0:功能关闭
    double d1ShadowScopeEnd; //柱1, 如无, 设为0; Shadow region Gap-1 end angle (°); 0:功能关闭
    double d1ShadowScopeSt2; //柱1, 如无, 设为0
    double d1ShadowScopeEnd2; //柱1, 如无, 设为0

    double d2ShadowScopeSt; //柱2, 如无, 设为0
    double d2ShadowScopeEnd; //柱2, 如无, 设为0
    double d2ShadowScopeSt2; //柱2, 如无, 设为0
    double d2ShadowScopeEnd2; //柱2, 如无, 设为0

    double d3ShadowScopeSt; //柱3, 如无, 设为0
    double d3ShadowScopeEnd; //柱3, 如无, 设为0
    double d3ShadowScopeSt2; //柱3, 如无, 设为0
    double d3ShadowScopeEnd2; //柱3, 如无, 设为0

    int nRepIteratorNum; //修补迭代次数
    int nRepGapDistThr; //Gap畸变阈值设定 mm
    int nRepPillarDist; //前柱距离范围阈值mm

```

八，效果示例（起效范围设定 1 米，0° - 360°）

调用前

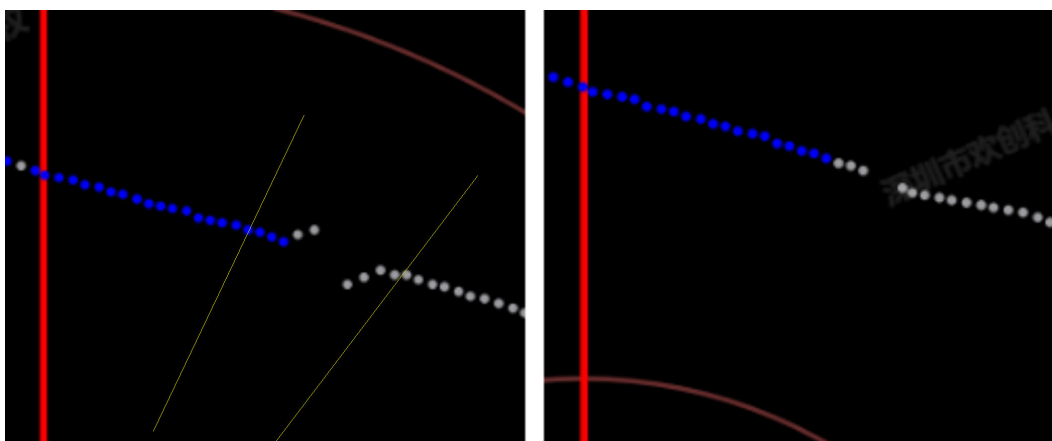

调用后

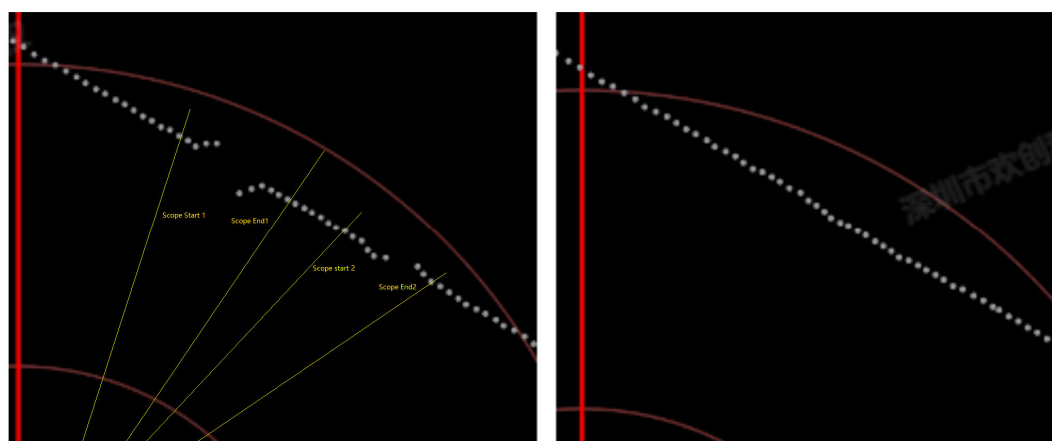

a, Shadow Gap 滤除处理

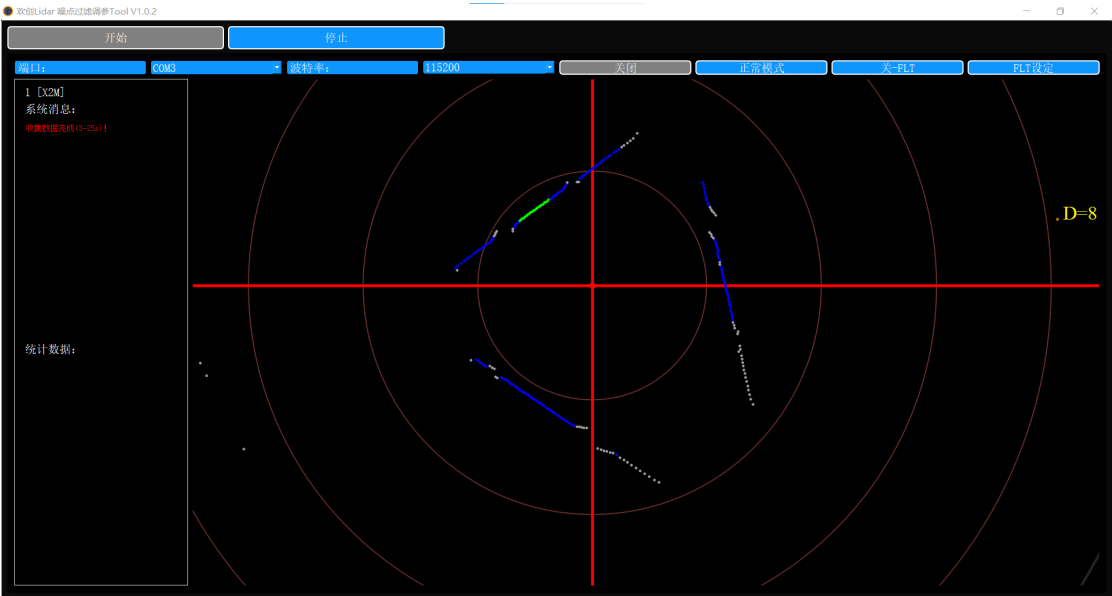

b, Shadow 平滑处理

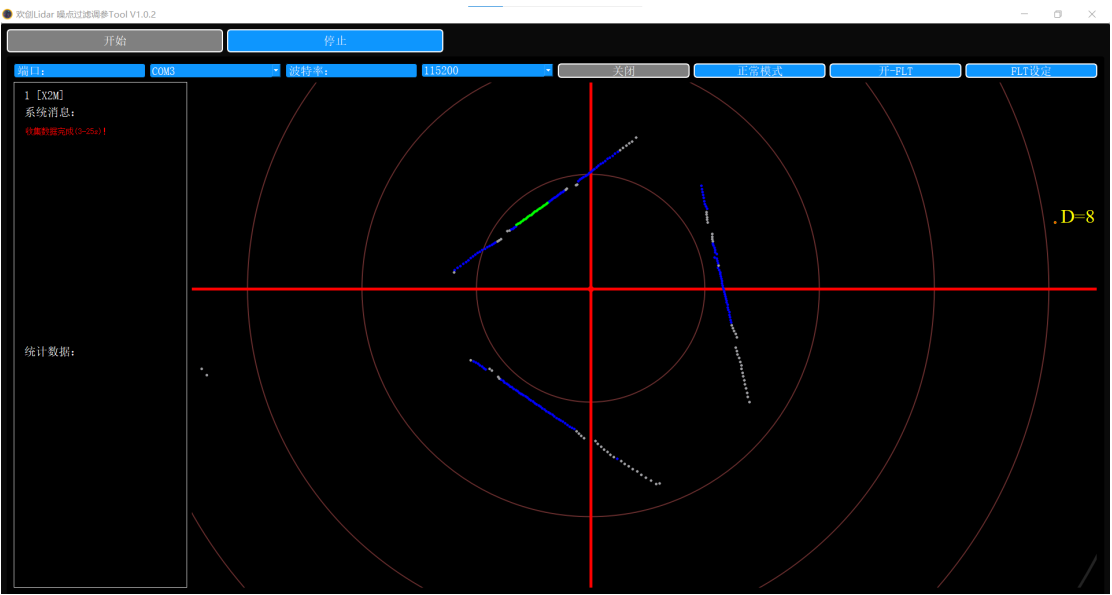

c, Shadow Gap 补缺处理

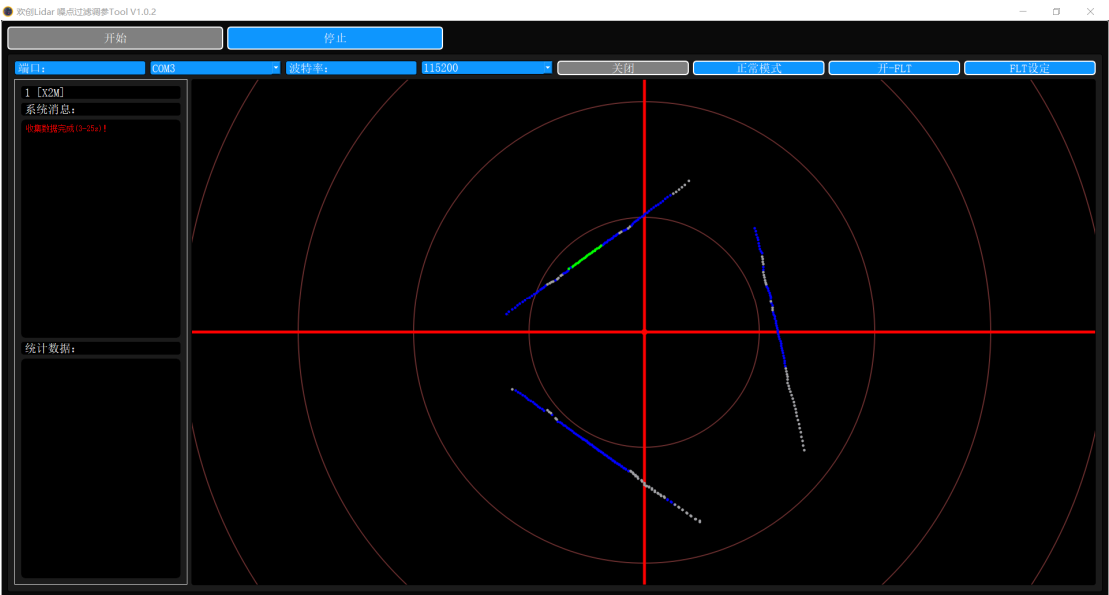

前柱缺口处理关

前柱缺口平滑开

前柱补缺开

回充识别
